ROOT & CODE HACKATHON MVP PROPOSAL

PastPort: Enter History. Shape Your Story.

Chapter Pilot: Bursa – The Dawn & Elegy of Waqf

---

1. Project Concept & Hackathon Alignment

This document establishes the comprehensive game design blueprint for the Bursa Pilot Chapter of **PastPort**, completely integrated into the existing adaptive-learning framework. This chapter directly addresses the KÖK&KOD Hackathon core problem statement by transforming semi-structured Waqf datasets into a next-generation digital character-growth experience.

While macroscopic history remains completely unyielding and historically accurate to honor authentic cultural memory, players navigate complex micro-plots, ethical crossroad decisions, and architectural clue explorations. It shifts the educational perspective from memorization to systemic understanding—revealing how historical Waqf foundations acted as vital socio-economic networks and community safe havens during imperial crises.

2. Historical Core & Verified Foundations

The chapter is set in 1553, immediately following the political execution of the beloved Prince Mustafa by his father, Sultan Suleiman the Magnificent. His mother, Mahidevran Hatun, is stripped of all imperial status and wealth, exiled textually to Bursa under strict surveillance by Istanbul secret agents.

The gameplay natively anchors onto three verified historical Waqf property sites in Bursa:

- **Koza Han (The Silk Market):** Built as a Waqf economic powerhouse whose commercial revenues funded major public infrastructures. In-game, it serves as the center of trading relationships, document smuggling, and underground guild financing.
- **Muradiye Imaret (The Soup Kitchen):** A core public welfare institution providing daily meals. In-game, it acts as a space for vulnerable social interaction, surveillance evasion, and local reputation management.
- **■ehzade Mustafa Mausoleum (Muradiye Complex):** The architectural focal point. It represents the historical struggle of Mahidevran to secure Waqf land and construct a monumental resting place under heavy political containment.

3. Micro-Plot Matrix & Multi-Ending Architecture

To solve the paradox of multiple narrative branches under a fixed historical timeline, the design maps player actions to distinct micro-plots and archival recordings without falsifying macro-outcomes. Every major decision updates variables such as *Reputation (Imperial vs. Dissident)*, *Waqf Resource Capital*, and *Trust Index*.

Player Trajectory	Micro-Plot Flow (The Human Fate)	Archival Output (Waqf Records)	Macro-Historical Continuity
Route 1: Strict Imperial Alignment (Manager betrays; Attendant submits)	The Manager climbs the bureaucratic ladder to Istanbul. The Attendant is compromised. Mahidevran spends her remaining years in complete financial and social isolation.	Asset ledgers record all items as 'Reclaimed Imperial Property.' The local public kitchen faces severe administrative budget cuts.	**Maintained.** The Muradiye Mausoleum is built late under standard state funding by Selim II.
Route 2: The Silent Resistance (Manager forges records; Attendant smuggles)	The Manager faces persistent local extortion by state spies. The Attendant establishes an underground network of loyalists in Koza Han to quietly fund the exiled household.	The dataset shifts: properties are masked in ledgers as 'Anonymous Mosque Restoration Funds' to bypass imperial search filters.	**Maintained.** The physical structure is completed, built secretly on the resilience of local citizens.
Route 3: Cultural Heritage Martyrdom (Manager sacrifices career; Attendant sacrifices life)	The Attendant burns incriminating letters to protect Mahidevran and is captured. The Manager uses the final *Vakfiye* deed to permanently secure the mausoleum site.	The sacred deed goes safely into the physical vault, ensuring the architectural layout is protected from crown confiscation.	**Maintained.** The physical site remains as it stands today, preserving the hidden names behind the tiles.

4. Technical Data Mapping & MVP Flow

To strictly fulfill Technical Evaluation 5.1.1 and 5.1.3, the provided raw semi-structured hackathon package is parsed natively into a relational database layer. The game engine processes fields such as *province*, *property_type*, and *history* to generate interactive, accessible nodes.

The Shared Object Core Loop:

Both playable characters converge on a single, high-stakes inventory asset: *The Prince Mustafa Legacy Poetry & Deed Portfolio*. The Attendant must move it across exploration nodes to unlock security zones. The Manager must decide whether to seize the object to fulfill imperial tracking metrics or execute a validation stamp to log it permanently into the Waqf state database, altering the final micro-plot outcome dynamically.
